

TechCore - Retail Sales Analysis

Strategic Conclusions and Recommendations
DataVision Analytics | Soy Henry - Data Science | Daniel Palmera | 2026

Executive Summary - Key Indicators

Analysis performed on 30,000 clean invoices from TechCore national sales across 6 branches in 4 cities.

30,000 Invoices analyzed	60,059 Detail lines	468 bn COP Total revenue	2.0 Products / invoice
30 Active salespeople	6 Branches	4 Cities	10+ Brands in portfolio

Analysis Conclusions

1. Geographic Revenue Concentration

Bogota and Medellin account for approximately 70% of total revenue. This reflects higher population density and purchasing power, but also represents a concentration risk: any operational disruption in these two cities would critically impact TechCore's overall results.

2. Brand Leadership: Lenovo in Revenue, HP in Units

Lenovo leads total revenue at approximately \$117 bn COP, driven by mid-to-high range equipment. However, HP tops the units-sold ranking, with the HP Spectre x360 being the highest-volume individual product. This divergence indicates HP has higher rotation in the mid-price segment, while Lenovo captures more value per unit.

3. Purchase Behavior: Active Upselling

The average of 2 products per invoice indicates that salespeople are successfully executing upselling and cross-selling strategies. In the technology retail sector, maintaining an average above 1 product per ticket requires an effective consultative sales process.

4. Low Client Recurrence

Approximately 92% of transactions correspond to clients with a single recorded purchase in the period. This is expected in the computer sector (long purchase cycles), but it signals an opportunity: capturing the client for accessories, extended warranties, and upgrades can double the customer lifetime value without acquiring new buyers.

5. Payment Method Diversity

The presence of three payment methods (card, cash, and bank transfer) shows commercial flexibility. The bank transfer segment correlates with higher average tickets, suggesting high-end buyers prefer this channel. Optimizing the digital payment experience can accelerate closing in this segment.

6. Opportunity in Cali and Pereira

Cali and Pereira show lower volumes, but with average tickets comparable to the main cities. This indicates that demand exists and the bottleneck is commercial coverage (number of branches and salespeople), not market purchasing power.

Strategic Recommendations

#	Recommendation	Detail
1	Expand in Cali and Pereira	Add at least one branch per city and reinforce local sales teams. The average ticket is already competitive;
2	Post-Sale Loyalty Program	Implement a post-purchase CRM with accessories, extended warranty, and personalized upgrade offers. L
3	Predictive Inventory Management	Lenovo and HP have the highest turnover. Apply a demand model based on dashboard historical data (sea
4	Per-Salesperson Dashboard with RLS	Enable dashboard access with Row-Level Security activated so each salesperson sees only their own indic
5	Product Mix Optimization by Branch	Each branch shows a slightly different brand distribution based on its area demographics. Analyzing the co

Recommended Next Technical Steps

- Connect the dashboard to a real-time data source (SQL database or API) to replace manual Excel uploads.
- Add a profitability analysis page if product cost data is incorporated (currently only sale price is available).
- Implement automatic alerts via Power BI Service when daily sales fall below the historical average threshold.
- Enrich the model with external market data (competitor pricing, macroeconomic indicators) to contextualize seasonal drops or spikes.
